This heavily-illustrated work contains drawings and identification information for more than a thousand mollusks native to New Zealand. Published under the authority of the government of New Zealand, the

book took author Henry Suter more than 25 years to complete. Biologists have praised the high quality of the drawings, and the work is considered a landmark in New Zealand conchology. I fiori sono un patrimonio da salvaguardare. La loro bellezza è espressione di uno straordinario meccanismo naturale che garantisce la riproduzione delle piante. Imparare a riconoscerli e a coltivarli favorisce la tutela della biodiversità. Questo volume risponderà a tutte le vostre domande sulle più note e diffuse specie da fiore con un linguaggio semplice e con un approccio pratico, fornendo notizie generali e molte curiosità sulle piante da fiore in Italia e nel mondo. Le fotografie, una ricca sezione illustrata e tabelle per la scelta dei fiori fanno di questa guida lo strumento ideale per il riconoscimento e la coltivazione delle piante da fiore. With about 10,000 species living in salted and brackish waters, foraminifera constitute the most diverse group of shelled microorganisms in modern oceans, and substantially contribute to biodiversity. Abundant and sensitive to environmental conditions, they constitute one of the most valuable tools for environmental assessment and monitoring programs. Preservation of their mineralized test in the sediment allows the reconstruction of past conditions, including Global Change. This book gives an introduction to foraminifera, designed to be accessible to non-specialists, and summarize the main researches that have been carried out on foraminifera from New Caledonia. The main part of the guide describes and illustrates more than 1,000 species of foraminifera collected in a great variety of environments around New Caledonia. For each species, SEM micrographs are associated with a description and notes on its distribution. In order to facilitate identification, even by non-specialists, species are recorded in alphabetical order within groups made on the basis of (1) the nature of the test and (2) the dominant morphological feature. A photographic summary is provided for preliminary identification. This identification guide includes 552 species of mesopelagic fishes (i.e. those fishes residing primarily between 200-1000 m depth during daytime) that are known to occur in the central and south east Atlantic Ocean. Fully illustrated dichotomous keys to all taxa are provided. Species are treated in detail, with accounts including the scientific name, FAO common name in English (where available), other useful characters, size, a distribution map, and one or more illustrations. To facilitate even further the identification of the taxa, captions and arrows are added to help users quickly locate their key morphological features. The guide is intended for both specialists, and nonspecialists who have a working knowledge of ichthyology.
